

**Section 8.3**  
**Approximate Coloring Algorithms**

---

---

---

---

---

---

---

---

**CHROMATIC NUMBER PROBLEM**  
The question of determine the chromatic number of a graph is an NP-complete problem.

---

---

---

---

---

---

---

---

**CONSIDERATIONS FOR HEURISTICS**

1. A vertex of high degree is harder to color than a vertex of low degree.
2. Vertices with the same neighborhood should be colored alike.
3. Coloring many vertices with the same color is a good idea.

---

---

---

---

---

---

---

---

**GENERIC SEQUENTIAL COLORING ALGORITHM**

**Algorithm 8.2.1 Generic Sequential Coloring Algorithm.**

**Input:** Any ordering of the vertices of a graph  $G$ .

**Output:** A coloring of the vertices.

**Method:** Use the minimum available color

1. Assign color 1 to vertex  $v_1$ .
2. If  $H_{i-1} = \langle v_1, v_2, \dots, v_{i-1} \rangle$  has been colored with  $j$  colors, then assign  $v_i$  with color  $k$ , where  $k \leq j + 1$  is the minimum available color (according to some numerical ordering of the colors, say  $1, 2, \dots, n$ ).

---

---

---

---

---

---

---

---

---

---

**LARGEST FIRST HEURISTIC**

- The **largest first heuristic** orders the vertices in descending order based on their degrees.
- The vertex of highest degree is colored first, the next highest second, and so forth in a greedy manner.
- In each case, the color selected is the smallest possible legal color.
- This heuristic provides a good bound on the chromatic number of small-order graphs

---

---

---

---

---

---

---

---

---

---

**A THEOREM OF WELSH AND POWELL**

**Theorem 8.3.1 (Welsh and Powell):** Let  $G$  be a graph with  $V(G) = \{v_1, v_2, \dots, v_n\}$  and where  $\text{deg } v_i \geq \text{deg } v_{i+1}$  for  $i = 1, \dots, n - 1$ . Then

$$\chi(G) \leq \max_i \min\{i, \text{deg } v_i + 1\}.$$

---

---

---

---

---

---

---

---

---

---

### SMALLEST LAST ALGORITHM

In the **smallest last algorithm**, the vertex ordering is as follows. Let  $G$  be a graph.

- Remove the vertex of lowest degree from  $G$  and place it last on the list of vertices.
- In the subgraph that remains, select the vertex of lowest degree and place it on the list.
- Repeat until there are no more vertices.
- Color the vertices sequentially (first in-last out) in a greedy manner

---

---

---

---

---

---

---

---

### COLOR DEGREE

The **color degree** of a vertex  $v$  is the number of colors used to color the vertices adjacent to  $v$ .

---

---

---

---

---

---

---

---

### BRELAZ COLOR-DEGREE ALGORITHM

**Algorithm 8.2.2 Brelaz Color-Degree Algorithm.**

**Input:** A graph  $G$ .

**Output:** An approximate coloring of the vertices of  $G$ .

**Method:** Break ties based on the smallest color degree.

---

---

---

---

---

---

---

---

**BRELAZ COLOR-DEGREE ALGORITHM  
(CONCLUDED)**

1. Order the vertices in decreasing order of degrees.
2. Color the vertex of largest degree with color 1.
3. Select a vertex with maximum color-degree. If there is a tie, chose any of these vertices of largest degree in the uncolored graph.
4. Color the vertex selected in step 3 with the least possible color.
5. If all vertices are colored, then stop; else go to step 3.

---

---

---

---

---

---

---

---

**A THEOREM ON ALGORITHM 8.3.2**

**Theorem 8.3.2:** If  $G$  is a 2-connected bipartite graph of order at least 3, then the coloring obtained from Algorithm 8.3.2 determines the chromatic number for  $G$ .
